Implementation of the WUMPUS Game

We implemented the Wumpus World as a knowledge-based agent in Python (file: `wumpus_fixed.py`).

The game follows all rules from Dr. A. Taylor's lecture notes and uses the exact cave map from class

Implementation Choices Using the PEAS Model

We designed the agent using the PEAS framework as taught in the unit:

1. Performance Measure

- +1000 for climbing out with the gold
- -1000 for death (pit or eaten by Wumpus)
- -1 for every action
- -10 when shooting the arrow

2. Environment

4×4 grid cave (discrete, deterministic, static, sequential, partially observable, single-agent) using the exact map that was demonstrated in class.

3. Actuators

- Move: up, down, left, right
- Shoot in any direction
- Grab gold
- Climb (only at [1,1])

4. Sensors

- Stench (adjacent to Wumpus)
- Breeze (adjacent to pit)
- Glitter (on gold square)
